4 Description.....	2

## 1. Synopsis

Delete the original files from your memory card.

## 2. Prerequisites

None.

## 3. Configuration

### **IMG\_PREFIX**

Prefix of the images (lowercase. e.g. dsc\_, img\_).

### **IMG\_EXT**

Extension of the images (lowercase. e.g. jpg, nef, crw).

### **CP\_LIMIT=0|number**

If unset or set to zero, all images are deleted. Otherwise, at most *number* images are deleted.

## 4. Description

At the end of your workflow, when the images are processed, archived and hopefully a backup exists, you can delete the original files from the memory card. Use at your own risk.

Note that this module uses the same configuration-variable `CP_LIMIT` as the module [copyFiles](#). This insures that only those images that were copied to hard disk and processed are actually deleted.
