alignImages

Table of contents

1. Synopsis

Align a group of images using `align_image_stack` from <u>Hugin</u>.

2. Prerequisites

This module needs an HDR-list-file (config-var HDR_LIST) generated by module <u>findGroups</u>. Also the module <u>fixCA</u> must run before alignImages.

3. Configuration

IMG_ALIGN=1|0
Align images if set to one. Otherwise the module just creates a symbolic link to the files created by module <u>fixCA</u>.
AIS_PREFIX
Prefix for generated images. Defaults to `ais_`.
IMG_DIR
Working directory. This module expects it's input files in this directory and creates it's output files in this directory.

4. Description

You need alignImages if you shoot your image-sequences without a tripod. Even with a tripod your images might need it, since a misalignment of only a few pixels could nevertheless be possible. You should always use alignImages in your workflow, since other modules like <u>enfuseImages</u> or <u>makeHDR</u> depend on it.

The module creates files with the prefix `ais_`. In case of images not part of a sequence, the module creates symlinks to the respective `ca_`-file generated by <u>fixCA</u>.
